 Summary of Emissivity Intercomparison Participant Groups and Data Set Attributes
 I

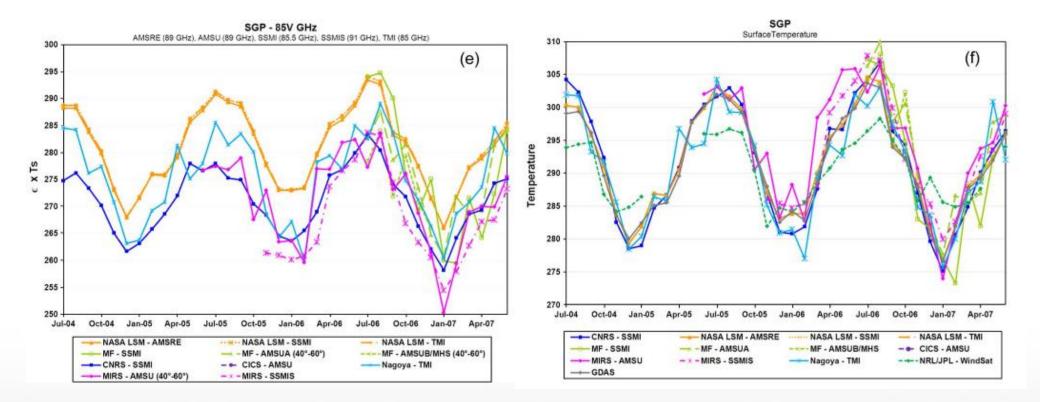

TABLE II

DISTINCTION BETWEEN THE THREE MAIN APPROACHES TO MICROWAVE SURFACE EMISSIVITY ESTIMATION USED IN THIS INTERCOMPARISON STUDY

Туре	Principle	Input Parameters	Advantages	Disadvantages
Land Surface Model	Dense media radiative transfer theory	Surface parameters (soil type, snow properties, etc)	Naturally couples to land surface models	Dependent upon realism of specified surface parameters
Direct observational	Observationally based	Satellite observations, land and atmosphere properties	No surface parameters needed other than temperature	Only works for partially- opaque atmospheric conditions, dependent upon land surface temperature and atmospheric profile and atmospheric model assumptions
Physical Retrieval	Parameterized radiative transfer	Satellite observations	Physical consistency amongst retrieved surface parameters	Parameterizations may not work well above X-band

[Ferraro et al. 2013, IEEE]

Previous Study for Retrieval Land Surface Emissivity

SGP: 1-degree box centered of the Southern Great Plane site (36.6° N, 97.5°W)

[Ferraro et al. 2013, IEEE]

Methodology

Atmospheric contribution

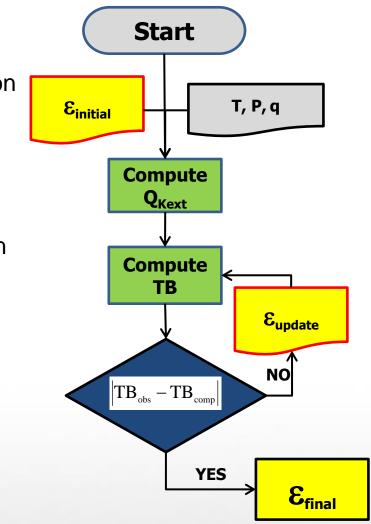

- Upwelling and downwelling atmospheric emission
- RTM: Plane parallel Eddington approximation

Satellite observation

Conically scanning PMW radiometer observation

Retrieval

Physical constraint for the emissivity

Dataset

TRMM TMI observation data

- Brightness temperatures for 9 channels (10 ~ 85 GHz)
- Period: 2011.01.01 ~ 2012.12.31

Korea Local Analysis and Prediction System (KLAPS) reanalysis data

- Resolution: 5 km x 5 km
- Vertical profiles of temperature and humidity, surface temperature

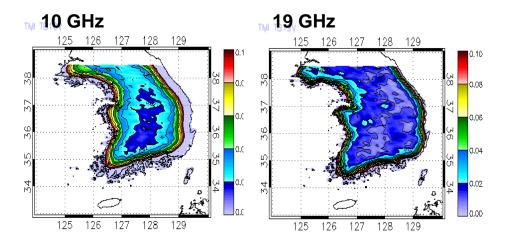

COMS cloud data

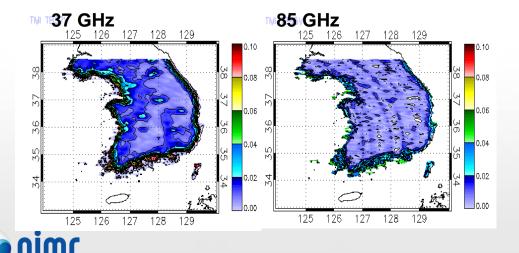

- Resolution: 4 km x 4km
- Level 2 cloud detection (0: clear, 1: cloud)

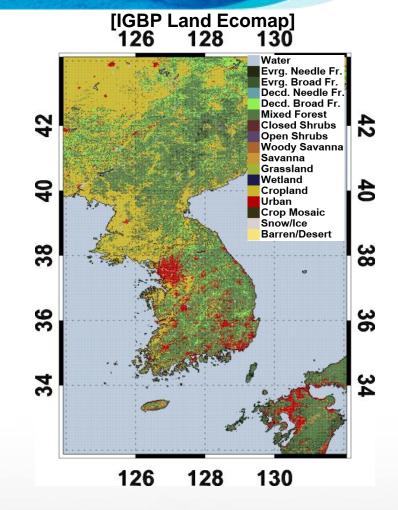

Polarization Difference

Polarization Difference (Ev – Eh)

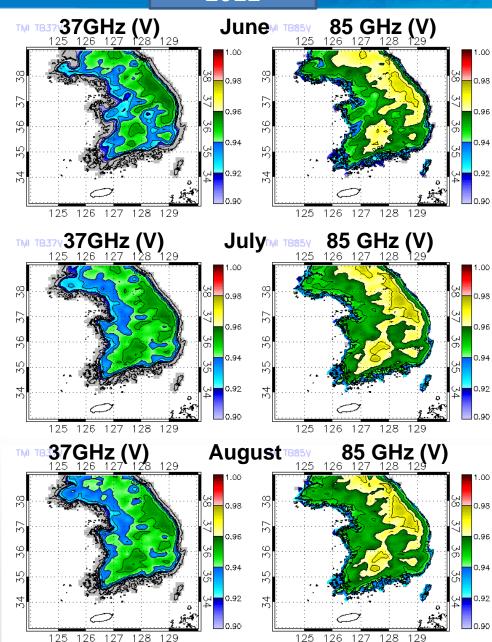

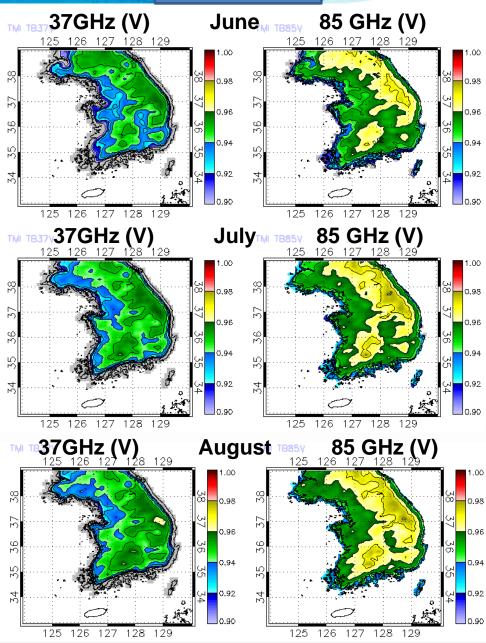

Surface	19 GHz	85 GHz
Woody	< 0.10	< 0.08
Desert	> 0.10	> 0.08

Emissivitv map : TRMM + KLAPS

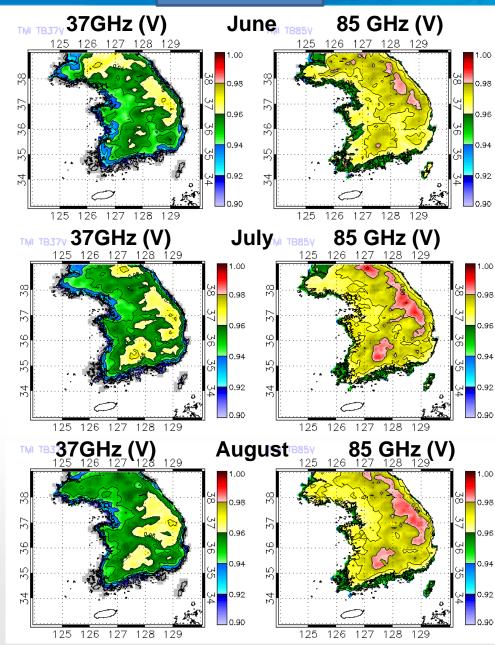

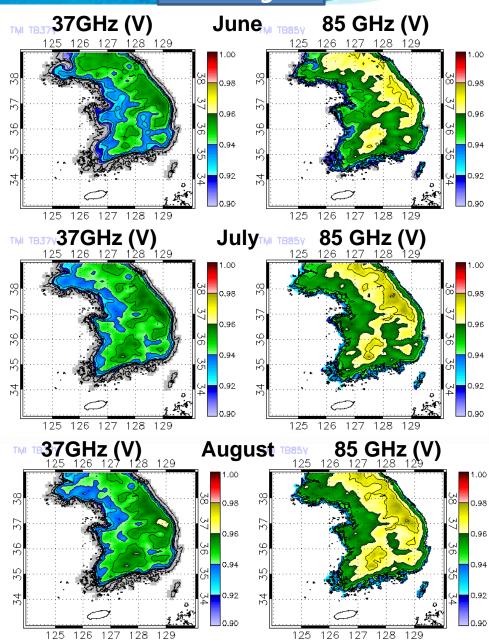

Emissivity map : TRMM + KLAPS

TB Difference btw Clear and Rain

Clear sky with no cloud

- \rightarrow IR has an advantage for cloud detection than MW.
- → To find clear pixel, COMS* cloud detection data were used to remove contaminated pixel.
- \rightarrow It is possible to make error for low and thin cloud.

Rain sky with radar

- \rightarrow Radar can detect rain drop widely.
- \rightarrow Operational radar system over Korea was used to detect rain pixel.
- \rightarrow It is possible to make error for mountainous region.

Spatial and temporal average

- ightarrow 0.1 $^{\circ}$ x 0.1 $^{\circ}$ gridding
- \rightarrow Monthly average for given grid.
- \rightarrow To avoid ocean effect, only inland area (127.25E ~ 128.75E, 35.5N ~ 37.5N) is selected.

COMS: Communication, Ocean and Meteorological Satellite

TB Difference btw Clear and Rain
